## RESEARCH PAPER

# Feelings of loneliness, but not social isolation, predict dementia onset: results from the Amsterdam Study of the Elderly (AMSTEL)

**Table 2** Bivariate associations of risk factors with clinical dementia (OR with 95% CI) (N=158)

Variable	Dementia (n (%))	Dementia (OR (95% CI))
Social isolation		
Living alone		<b>1.72 (1.24 to 2.40)</b>
Yes (n=1005)	93 (9.3%)	
No (n=1166)	65 (5.6%)	
Not/no longer married		<b>1.80 (1.29 to 2.52)</b>
Not/no (n=1100)	101 (9.2)	
Married (n=1071)	57 (5.3)	
Social support		<b>0.46 (0.33 to 0.64)</b>
No (1590)	89 (5.6)	
Yes (578)	66 (11.4)	
Feelings of loneliness		<b>2.56 (1.82 to 3.61)</b>
Yes (n=433)	58 (13.4)	
No (n=1737)	99 (5.7)	

# **Loneliness, Social Integration, and Incident Dementia Over 6 Years: Prospective Findings From the English Longitudinal Study of Ageing**

**Table 2.** Cox Proportional Hazards Regressions of the Incidence of Dementia (2006–2012) on Social Relationship Measures

Marital status <sup>e</sup>	Model 1 1.77 (1.29–2.44)*	Model 2 1.77 (1.29–2.44)*	Model 3 1.96 (1.41–2.71)*	Model 4 1.98 (1.43–2.73)*	Model 5 2.11 (1.52–2.92)*
Social isolation: 0		1 [ref]			1 [ref]

OR, odds ratio; CI, confidence interval.

<sup>a</sup> Goodness of fit determined by Hosmer-Lemeshow analysis.

Model 2: Adjusted for demographics (age, family structure, body mass index, and pensions), the number of comorbidities, the number of medications used, behavioral factors (alcohol and smoking), psychosocial factors (cognitive function, depression, and social support) and physiological factors (ADL and IADL).

# The mix matters: Complex personal networks relate to higher cognitive functioning in old age

*Changes in cognitive functioning (MMSE) over time,  
by different levels of network complexity*

# Caratteristiche delle relazioni sociali e rischio di demenza

# Apathy is associated with incident dementia in community-dwelling older people

# Symptoms of apathy independently predict incident frailty and disability in community-dwelling older adults

# Social activity, cognitive decline and dementia risk: a 20-year prospective cohort study

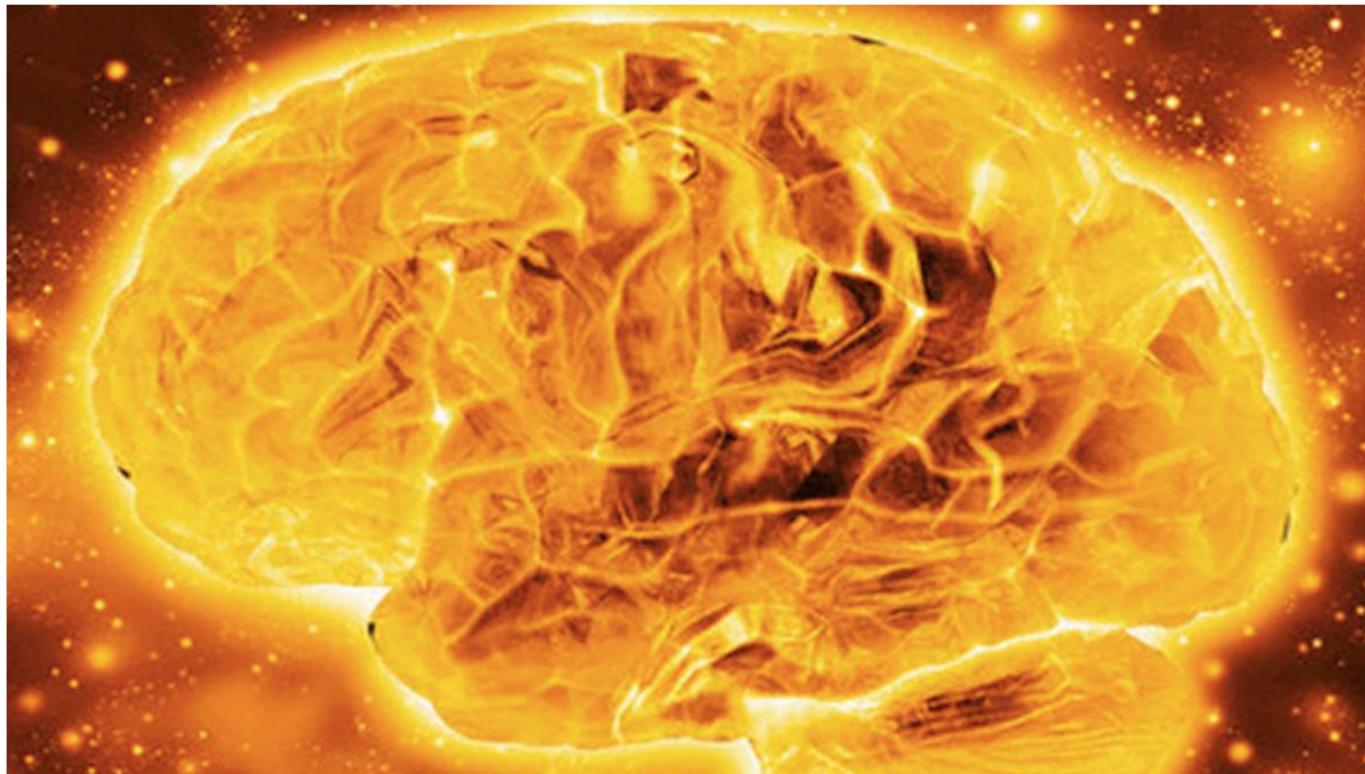

*2854 elderly (mean 77 yo) from South France followed for 20 years*

*"In the whole population, we found associations between increased engagement in **social**, **physical**, or **intellectual** pursuits and increased cognitive ability (but not decline) and decreased risk of incident dementia, and between feeling understood and slower cognitive decline."*

# Il segreto degli umani è il cervello sociale

Il successo dell'*Homo sapiens* come specie dipende dalla dimensione delle sue reti sociali. Per l'uomo il massimo sarebbe di 150 amici

21 agosto 2012 di [Caterina Visco](#)

Il segreto del successo della **specie umana** e di ogni singolo individuo è il suo *cervello sociale*: la capacità di formare un gran **numero di relazioni** diverse. È la conclusione di 20 anni di studi sul **cervello** dei primati condotti dall'antropologo britannico **Robin Dunbar**, l'ultimo dei quali pubblicato su *Proceedings of the Royal Society B*.

# Conclusioni

- L'assenza di contatti sociali e soprattutto i sentimenti di solitudine aumentano il rischio di demenza
- Al contrario, avere varie relazioni sociali protegge dal rischio
- Non è solo la quantità di relazioni sociali, ma anche la qualità delle relazioni stesse a determinarne l'effetto protettivo
- Apatia sia un fattore di rischio dell'evoluzione a demenza
- Solo la stimolazione dell'anziano in casa di riposo riduce la demenza, non basta un uso più accorto della terapia farmacologica

*Il 13 novembre è la giornata mondiale della gentilezza, un sentimento oscurato dall'odio sociale e dalle prevaricazioni. Mettiamo da parte l'aggressività e rispolveriamo le buone maniere: la scienza dice che garbo ed educazione possono migliorarci la vita*
